POC FINDINGS

Octane Obit | Octane vs FDC reconciliation, Petrocity Bonje

Test site

Petrocity Bonje
23 Sep to 27 Oct 2026 (35 days)
Diesel and petrol

Prepared by

Summit Surds Ltd.
Octane Obit | Forecourt & Fuel Management
29 October 2026

Result

Octane matched the FDC on 32 of 35 days (within 1 litre). The 3 days with differences are 23 Sep, 1 Oct and 3 Oct. Where they differ, Octane is missing transactions the FDC recorded, due to the FDC's slow FTP upload and a disconnect that left transactions on the device. It never records different amounts.

Fuel	FDC (L)	Octane (L)	Octane captured
Diesel	655,415.9	637,281.8	**97.2%**
Petrol	33,597.4	32,990.8	**98.2%**

Excluding the first day (23 Sep), Octane captured 99.7% of diesel and 99.6% of petrol.

Days that did not match

Date / window	Fuel	FDC (L)	Octane (L)	FDC minus Octane (L)	Note
23 Sep, full day	Diesel	28,151.68	11,790.08	16,361.60	POC start-up day: set-up was still being completed after the kick-off meeting. The rest of the day's data is still on the FDC. Fixing the FDC's FTP upload speed will bring it into Octane
23 Sep, full day	Petrol	1,005.31	522.94	482.37	Same cause. The data is still on the FDC
30 Sep 16:45 to 1 Oct 07:30	Diesel	25,816.62	24,044.09	1,772.53	A disconnect left these transactions on the FDC. The data is still there. Fixing the FDC's FTP upload speed will bring it into Octane
30 Sep 16:45 to 1 Oct 07:30	Petrol	1,522.54	1,403.82	118.72	Same window. The data is still on the FDC
3 Oct	Petrol	947.08	941.08	6.00	6 L of petrol had not reached Octane. The data is still on the FDC. Fixing the FDC's FTP upload speed will bring it into Octane

Why the differences happen

The differences are transactions that had not reached Octane yet. The FDC sends its data slowly, about one batch every 3 minutes, so transactions can queue for hours when the station is busy.

A simple example

- **Normal day, no backlog:** every sale is seen by the FDC and by Octane at the same time.
- **Internet goes down:** 100 sales are made. The FDC records all 100 and holds them in a queue.
- **Internet comes back:** the FDC sends the 100 sales to Octane slowly, about one batch every 3 minutes.
- **Sale 101 happens:** it joins the back of the queue. Octane cannot see it until the FDC has finished sending the first 100.
- **Result:** Octane is behind for as long as the queue lasts. Nothing is lost, because every sale is still on the FDC.

That is why we are asking ROHE to speed up the upload and to set out how the FDC clears a backlog, so new sales are never stuck behind old ones.

How to fix it

1. **ROHE:** increase the FDC's upload speed, or allow larger batches.
2. **ROHE:** define what the FDC does when there is a backlog and the most efficient way to catch up, so real-time forecourt activity is never held behind older transactions.
3. **Petrocity Bonje:** improve the station's internet connection, with more upload bandwidth and a stable link, so the FDC can send its data without delays or drops.
4. **Octane:** no change needed. Once the above is in place, the transactions still stored on the FDC reach Octane automatically and Octane reconciles with them.

Once the upload speed is fixed and the backlog is cleared, Octane should match the FDC 100% every day. This includes the 3 days with differences (23 Sep, 1 Oct and 3 Oct): their transactions are still on the FDC and will upload to Octane automatically.
